Week 1: Self study

Programming

1. Practise your Python on the online learning platform, Grok Learning, <https://groklearning.com>.
 - (a) Login to Grok Learning with your university email and password
 - (b) If needed, start with *Intro to Programming (Python) by Grok Learning* to practise the Python basics.
<https://groklearning.com/course/intro-python-1/>
 - (c) Otherwise, you can attempt *Intro to Programming 2 by Grok Learning* to practise the intermediate Python skills.
<https://groklearning.com/course/intro-python-2/>
2. Setup your Python environment with `numpy`, `sklearn` and `nlTK` packages installed (i.e. you can `import` them).

There are no workshops in week 1. However, one lab session with a tutor will be arranged in week 1 to help you with Python programming. You can come to the lab session if you have any questions about Python. Details about the lab session will be announced on LMS.

Catch-up

- (Re-)familiarise yourself with Python, if you haven't used it recently. In particular, focus on string and array processing, including regular expressions. Also revise functions and mapping mathematical formulae to Python syntax (including the `numpy` package).
- Familiarise yourself with the Natural Language Toolkit (NLTK). You might like to use the e-book <http://nltk.org/book> as a resource; it also covers some of the basics of Python, if you've never used the language before.
